DETAILED ACTION

1. This is in response to request for reconsideration filed on 3/3/03 in which claims 17-21 are pending. The applicant's request has been fully considered but they are moot based on the new ground of rejection. (See examiner new rejection and examiner response).

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 17-20 are rejected under 35 U.S.C. 102(b) as being anticipated by Thesling, III et al U.S. Patent No 5,657,354.

As per claim 17, Thesling, III et al discloses a demodulator (see figs. 2 and 15 element) having a Ration Planar approximation (see figs. 2 and 25 element LLRPA and col.1, lines 23, 45) which is considered to the claimed (power approximation circuit) coupled to receive a real and an imaginary component of a complex signal (see fig.15 elements I', Q' and col.10, lines 6-8) the

Art Unit: 2631

power approximation circuit generating an approximate power (col.3, lines 5-15) value which indicates an actual power value for the complex signal by a difference device which is considered to the claimed (combining) (see fig.15 element 153 and col.10, line 14) absolute values of the real and imaginary components (see fig.15 elements 151, 152 and col.10, lines 10-13) and then applying a expectation function (see fig.15 element LLRPA and col.1, lines 23, 45 and col.5, lines 64-67 and col.6, lines 1-50 and col.10, lines 23-30) to the combined absolute values.

As per claim 18, the demodulator of Thesling et al includes detection of at least one signal-to-noise ratio (see col.5, line 46).

As per claims 19 and 20, the demodulator of Thesling et al includes an external processor which includes a lookup table (see col.3, lines 60-67) that maps the approximate power value.

Allowable Subject Matter

4. Claim 21 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

5. The following is a statement of reasons for the indication of allowable subject matter: the present invention teaches a demodulator having a power approximation circuit. The closest prior

Art Unit: 2631

art of Thesling et al teaches a similar demodulator. However the closest prior art fails to anticipate or render obvious the recited features " a blind equalizer that generates a filter output signal in response to an information signal according to a transfer function which adapts in response to a selected error indication and a circuitry for providing the selected error indication by switching among a set of differing error indications in response to a determination of a relationship between the actual signal-to noise ration and a threshold signal to noise ratio". In combination with the rest of the system, these distinct features have been cited in dependent claim 21, and render it allowable.

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Guilford et al U.S. Patent No 5,455,847 teaches a clock recovery.

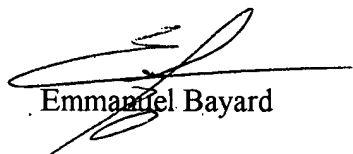

Chen U.S. Patent No 5,668,545 teaches a simplified encoding.
